PROFESSIONAL SUMMARY

React developer with 1.6+ years building production MERN features in a live SaaS product, owning each feature end to end: UI in React (Redux Toolkit, TanStack Query), APIs in Node.js/Express, data in MongoDB. Built the HR module's payroll and payslip workflow, from compensation setup to emailed payslips. Performance-minded: cut a core module's response time from 9-10 seconds to ~200ms and moved heavy work off the request path, so the app stays fast for the people using it.

TECHNICAL SKILLS

Frontend: React.js, Redux Toolkit, TanStack Query, TypeScript, HTML, CSS, Tailwind CSS

Backend: Node.js, Express.js, REST API Design, MongoDB, Mongoose, JWT Authentication, Redis, BullMQ, API Validation (Yup), Error Handling

System Concepts: Event-Driven Design (EventEmitters), Schema Design, Middleware Engineering

Tools & Platforms: Git/GitHub, Postman, AWS S3, Cloudinary, Netlify, Vercel

WORK EXPERIENCE

Senior Associate Software Engineer | BIZ Nest, Panaji, Goa

Apr 2026 – Present

BIZNest SaaS Platform | Internal company management tool (35+ users)

- Built the HR module's payroll system end to end, replacing spreadsheets. HR sets up compensation structures in a React UI, the backend calculates **deductions, leave/attendance-based pay etc**, and payslips are generated and emailed to the employees automatically.
- Replaced synchronous report generation with a BullMQ/Redis job queue, adding cancellation, retry logic, and status polling so long-running reports stopped blocking the API.
- Cut latency on a core internal module from 9-10 seconds to ~200ms, rewrote the queries into proper MongoDB aggregation pipelines, trimmed the fetch to only the fields actually needed.

Associate Software Engineer | BIZ Nest, Panaji, Goa

Apr 2025

BIZNest SaaS Platform | Internal company management tool (34+ users)

- Decoupled audit logging from request handlers using Node.js EventEmitters, processing 500+ daily user events without adding latency to core operations.
- Replaced in-memory CSV loading in the Nomad Admin Portal with a Node.js Streams pipeline, processing ~1K records per upload with row-level error isolation. Built the AWS S3 image upload flow behind it, with file type validation and structured key naming.

Software Engineer Intern | BIZ Nest, Panaji, Goa

Apr 2025

BIZNest SaaS Platform | Internal company management tool (34+ users)

- Shipped modules including analytics dashboards (tailored for 7 departments), attendance tracking, ticket workflows, meeting scheduling, and leave management, using MongoDB aggregation pipelines to reduce query complexity on the frontend.

EDUCATION

Bachelor of Computer Applications | Don Bosco College, Panaji Aug 2020 – May 2023

CGPA: 8.94/10
